Is Inhaler Technique Training for Non-Respiratory Specialist Healthcare Professionals adequate?

Authors: Kay Anderson Respiratory Nurse Specialist; Christine Davis Clinical Administrator; Rachel Hardstaff Respiratory Nurse Specialist, Service Lead. North and West Hampshire Community Integrated Respiratory Service Southern Health NHS Foundation Trust. Contact: shft.respiratory-assessment@nhs.net

**Background:** Inhaled respiratory medication for patients with asthma and COPD is beneficial as it targets lungs, reducing risks of systemic side effects from oral therapy. Used correctly, inhalers can control respiratory symptoms, minimising risks of hospital admission from exacerbations (Usmani 2018).

**Aim:** To Identify the need for inhaler technique assessment training for non-respiratory specialist healthcare professionals

**Method:** Questionnaire to 2339 non-respiratory specialist healthcare professionals over 3 weeks

- 18.7% (439) returns from Pharmacists, Pharmacy Technicians, Registered Nurses, Occupational Therapists and Physiotherapists
- Pharmacy technicians highest respondents 74% (14) returns. Fewest returns from Registered nurses 17% (332)

**Results:**

- 90% of respondents confirmed they completed inhaler technique assessments either daily, weekly or monthly
- Across all healthcare professions, 36% had received inhaler technique assessment training
- 86% of these received training over 1 year ago
- 40% (171) did not know the difference between pMDI and DPI
- Non-respiratory specialists considered themselves more competent than confident completing inhaler technique assessments
- Competence was evidenced by 22% respondents through appraisal or competency document

**Conclusion:** Non-respiratory specialist healthcare professionals do assess inhaler technique. There is a clear need for education as a significant number identified themselves in need of training and were unable to identify the difference between pMDI and DPI. This should be a priority to improve patient care.

**Results:**

- 97% agreed inhaler technique assessment improves patient care
- 88% agreed if they received training on inhaler technique assessments it would improve patient care
- “Training would increase overall confidence” “I received training over 10 years ago and not sure if I am still using best practice” “Many new devices have become available which I’ve never been trained to use”
